The **NAVAJO** has a compact aerodynamic design capable of handling strong currents with its 121 lbs of axial thrust. It supports dual cameras (color, black & white) and has an ability to operate multi-beam sonars (Blueview, Didson) as well as acoustic scanning sonars. The Navajo also provides tooling options in the form of a 3 function manipulator, electric steel brush, and cp probe to name a few. This spread is ideal for observation and inspection projects where cost is critical and deck space is limited. All ROV operations are supported by an 8' X 10" control van which has been engineered and design according to Shell Appendix G specifications.

The **SUPER MOHAWK** can perform many of the task currently carried out by larger work class vehicles. It's fiberoptic capabilities provide a versatile solution for fitting additional survey equipment as well as leak detection systems, Blue View and Didson Sonars. The size and weight to thrust ratio combined with Five Function Manipulators makes this system an ideal light work class dive support ROV system. When outfitted with the auxillary HPU package, the Super Mohawk can operate a 14" diamond tip saw, grinder or support diver hydraulic tools. The Super Mohawk is rated for 2000 meters and comes with a TMS and LARS.

The **EVOLUTION** is a compact hydraulic light medium work class ROV. The Ethernet-based control system, and touch screen graphic user interface make this multi-purpose ROV system designed to carry out a range of subsea inspection and intervention activities including Dive & Survey Support, Maintenance & Repair, and General Intervention Tasks. The dual seven function Schilling manipulators and independent survey bottle with dedicated fiberline makes this system extremely versatile.
